

**Question 1**

Let

$$A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}.$$

Express  $A^n$  for every positive integer  $n$  as a  $2 \times 2$  matrix.

**Question 2**

- True or false: Every symmetric matrix can be expressed as a sum of two non-symmetric matrices.
- True or false: if the product of two matrices  $A, B$  is a zero matrix, then  $A$  or  $B$  is also a zero matrix.

**Question 3**

Let  $B$  be the transformation of the Euclidean plane which rotates every point by  $\pi/2$  radians around the origin.

- Given an arbitrary point  $(x', y')$  in the plane, what are the coordinates of  $B((x', y'))$ ?
- Represent  $B$  as a matrix.
- Give two conceptually different explanations as to why  $B^4 = I$ .

**Question 4**

Characterize all  $2 \times 2$  matrices  $A$  which satisfy  $A^2 = I$ .
